

For customers wanting to use a wireless connection

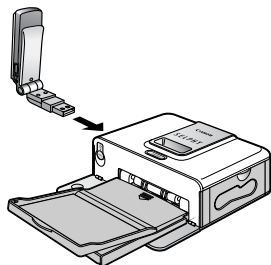

Canon

When you want to save or print your images, the PowerShot SD430 DIGITAL ELPH WIRELESS / DIGITAL IXUS WIRELESS lets you transfer them to a printer or personal computer without using a cable.

The diagram below shows you an outline of how to set up a wireless connection and lists the user guides you should refer to in order to learn more detail.

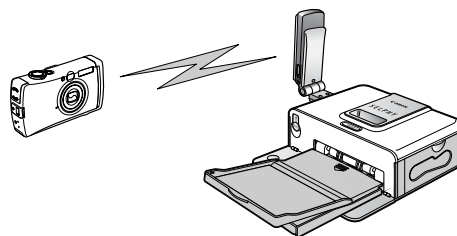

Using a wireless connection to print images

1 Getting ready

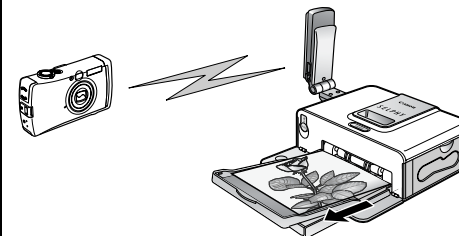

Attach the wireless print adapter (provided) to a Canon *PictBridge* compliant printer.

2 Setting up a wireless connection

Start the wireless connection by operating the camera.

3 Printing

Print the desired images.

Setting up a wireless connection to a computer

If you set up a wireless connection to a computer, you can transfer images you have already taken to the computer, but you can also shoot images and transfer them to the computer immediately (Auto Transfer), automatically print out transferred images, and even operate the camera's shutter button from the computer.

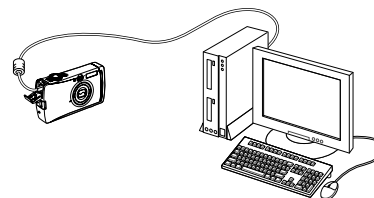

1 Confirming a wireless connection to a computer

2 Installing the software provided

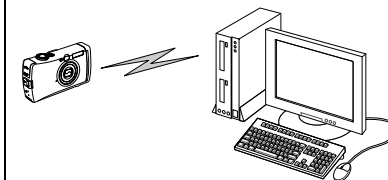

3 Registering the computer with the camera

Connect the camera and computer using the supplied interface cable and register the computer with the camera (first time only).

4 Setting up a wireless connection

Start the wireless connection by operating the camera.
